

# Instructions for setting up Java on your own machine

## Intro

In this class, you will be writing in Java. This page contains information on how to use it on your machine, split up by instructions for Mac and instructions for Windows.

If you have any questions or issues, feel free to reach out to anyone on the staff.

## Outline

[Mac Instructions](#)

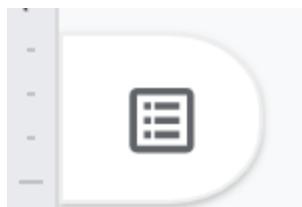

[Windows Instructions](#)

[CloudLabs Instructions](#)

[Editing Java Code](#)

[Running Java Code](#)

Additionally, you can click the Outline button to the left of this document to get a more detailed outline.

# Mac Instructions

To run most things on Mac, you will use an application called **Terminal**, which should already be downloaded onto your computer. [Here](#) is a quick tutorial on how to use the **Terminal**, however you will be going over the basics in lecture / lab, so this is just if you want to explore beyond what's in class.

**NOTE:** One thing to note throughout these instructions is that whenever a **Terminal** command is offered, don't include the "\$" in the command - that is there to signal to you that it is a terminal command.

## Java

You will be editing your code and running it in 2 separate locations.

### Getting Java on Your Machine

To check if you have Java, type the following command in your **Terminal**:

```
$ java --version
```

It should give you a version number that is 11 or higher.

If it doesn't list a number 11 or above, or if an error gets produced saying there is "No Java runtime present", then you need to get the updated version.

To do that, go to [this link](#). Scroll down to the download links (should look like the screenshot below). Click the button that says "jdk-13.0.2\_osx-x64\_bin.dmg". Accept the license agreement

Java SE Development Kit 13.0.2		
This software is licensed under the <a href="#">Oracle Technology Network License Agreement for Oracle Java SE</a>		
Product / File Description	File Size	Download
Linux Debian Package	155.72 MB	 jdk-13.0.2_linux-x64_bin.deb
Linux RPM Package	162.66 MB	 jdk-13.0.2_linux-x64_bin.rpm
Linux Compressed Archive	179.41 MB	 jdk-13.0.2_linux-x64_bin.tar.gz
macOS Installer	173.3 MB	 jdk-13.0.2_osx-x64_bin.dmg
macOS Compressed Archive	173.7 MB	 jdk-13.0.2_osx-x64_bin.tar.gz
Windows x64 Installer	159.83 MB	 jdk-13.0.2_windows-x64_bin.exe
Windows x64 Compressed Archive	178.99 MB	 jdk-13.0.2_windows-x64_bin.zip

When you've finished the download, click it and follow the installer. You might also have to double click the box (shown in the first photo below) to start the installer. You can move the installer to the trash when it's done.

Re-run the following java version command to make sure you have the correct version:

```
$ java --version
```

After running this command you should see:

```
java 13.0.2 2020-01-14  
Java(TM) SE Runtime Environment (build 13.0.2+8)  
Java HotSpot(TM) 64-Bit Server VM (build 13.0.2+8, mixed mode, sharing)
```

If you see this then you have correctly installed Java!

## Editing Java Code

To edit your Java code, we recommend the following 2 text editors.

Visual Studio Code

Follow [this](#) link, and click the Mac Download button:

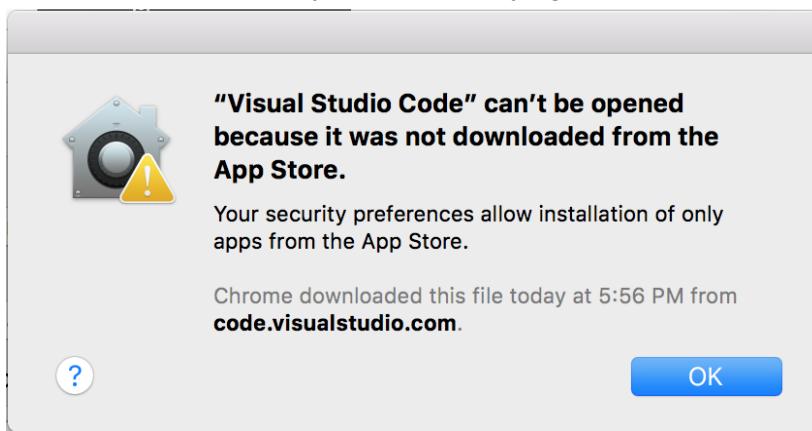

↓ Mac

macOS 10.10+

Open the downloaded file once it's done, and follow the instructions there on how to finish the download.

A possible error that may occur when trying to open VS Code is the following:

To fix this, do the following:

Open System Preferences through Spotlight Search

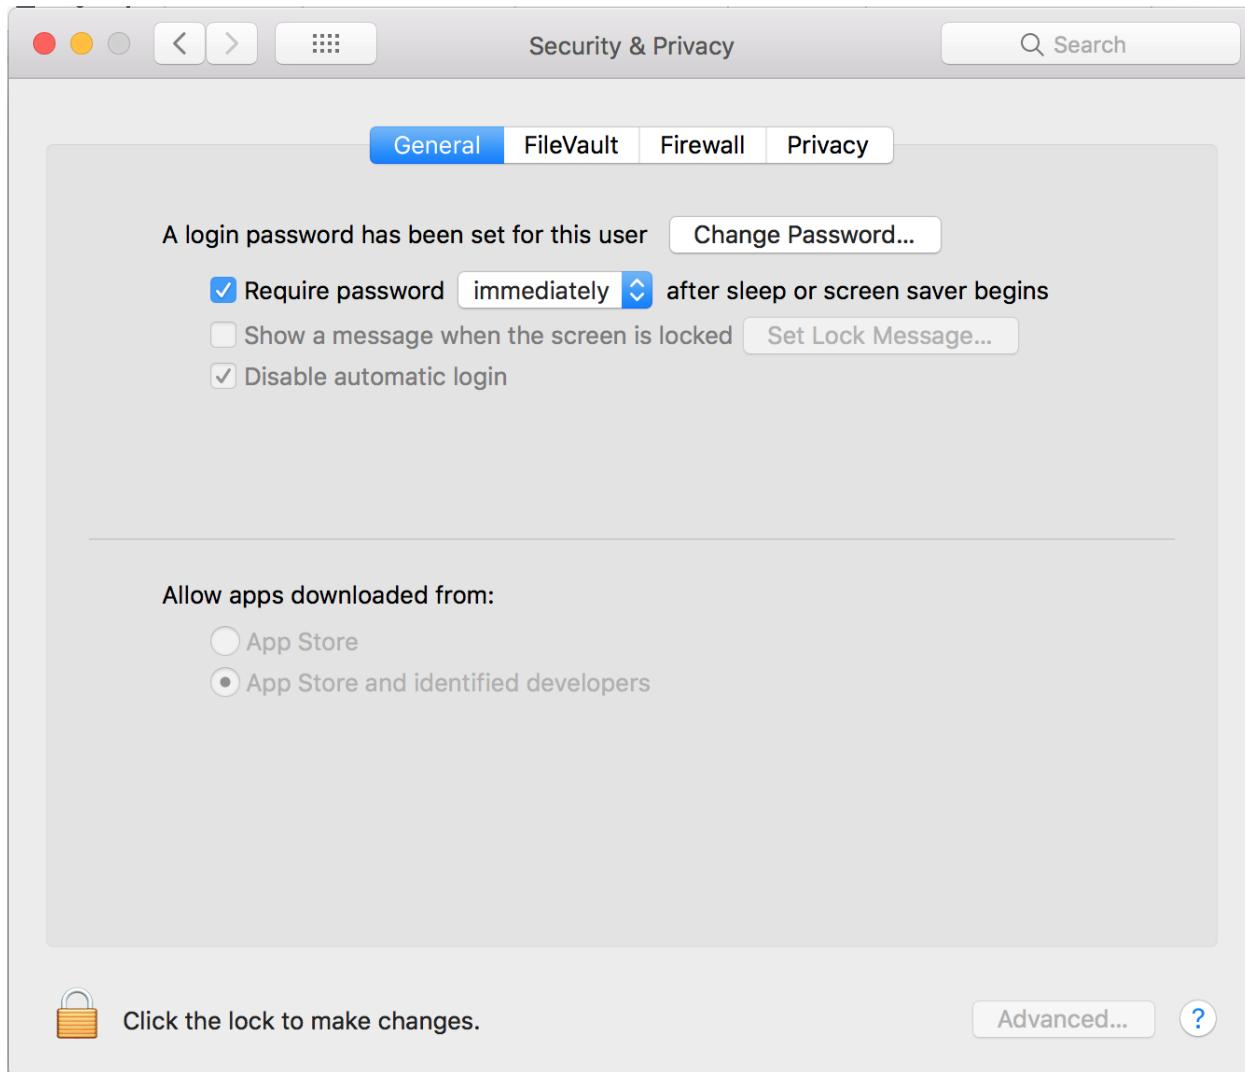

Click on Security and Privacy

Click on the lock symbol in the bottom left followed by entering your password

Then change the setting under "Allow apps downloaded from:" from App store to App Store and identified developers. Below is a screenshot of the correct setting

Finally, click the lock on the bottom left to lock the settings

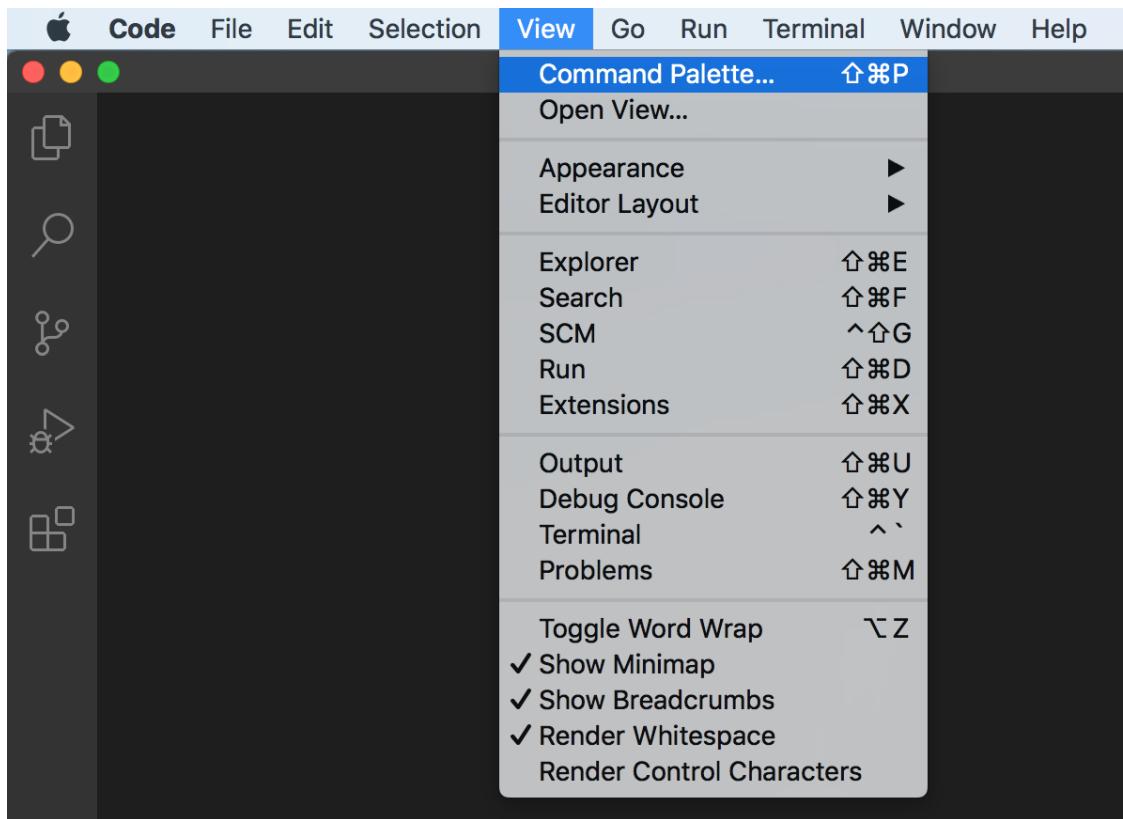

You should now be able to run the VS Code application

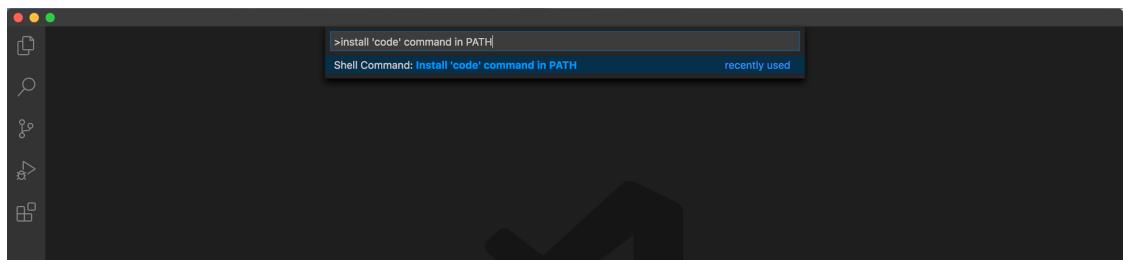

To open files in VS Code, there are two ways to do this.

- One way is to open VS Code itself first. From there, go to [File](#) > [Open](#), and choose the file you wish to edit.
- To run it from [Terminal](#), it is slightly more complicated (you need to do one step first to make it always work. Note that this step only needs to be performed the first time you open VS Code).

- First, open up the command palette within VS Code (type  $\text{⌘P}$ ) or click view on the top bar followed by the command palette option. Below is a screenshot of this

- Next type “Install 'code' command in PATH” into the command palette and hit enter. Below is a screenshot of this

- Now you can run the `Terminal` command. Open `Terminal`, and navigate to the folder where your file is located and type `code` followed by your file's name:

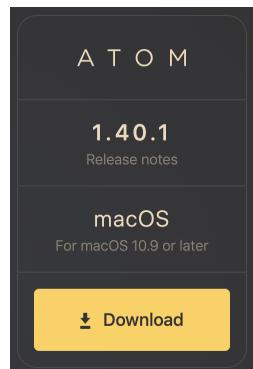

```
$ code fileName.java
```

For example, if I have a file called `helloWorld.java`, then I would type the following to open it in VS Code:

```
$ code helloWorld.java
```

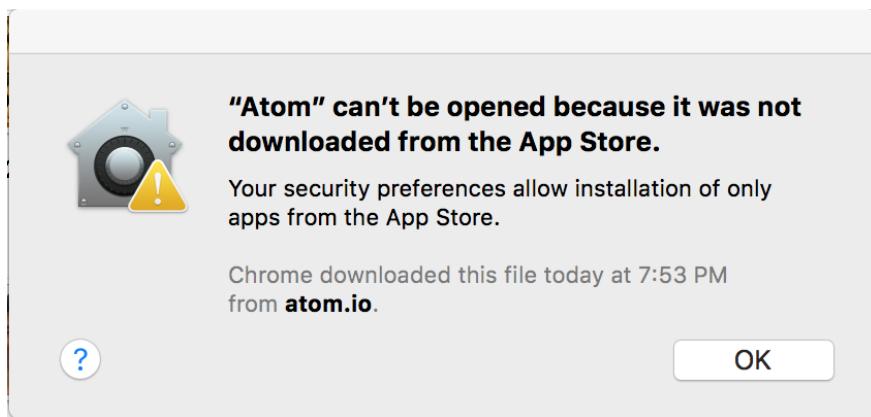

## Atom

Follow [this](#) link, and click the Download button:

Open the downloaded file once it's done, and follow the instructions there on how to finish the download.

A possible error that may occur when trying to open Atom is the following:

To fix this, do the following:

Open System Preferences through Spotlight Search

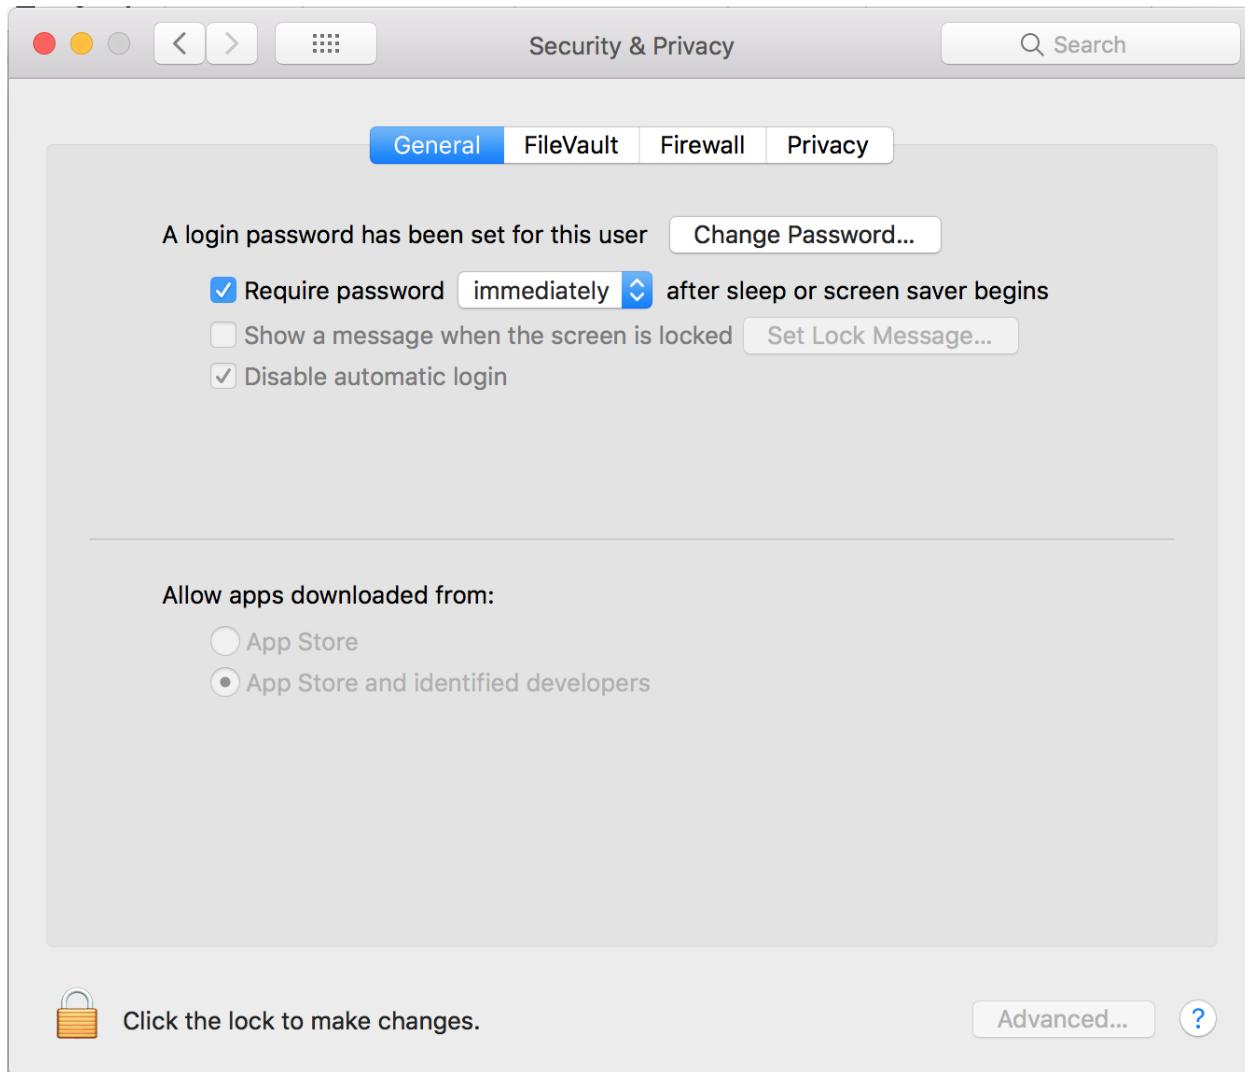

Click on Security and Privacy

Click on the lock symbol in the bottom left followed by entering your password

Then change the setting under "Allow apps downloaded from:" from App store to App Store and identified developers. Below is a screenshot of the correct setting

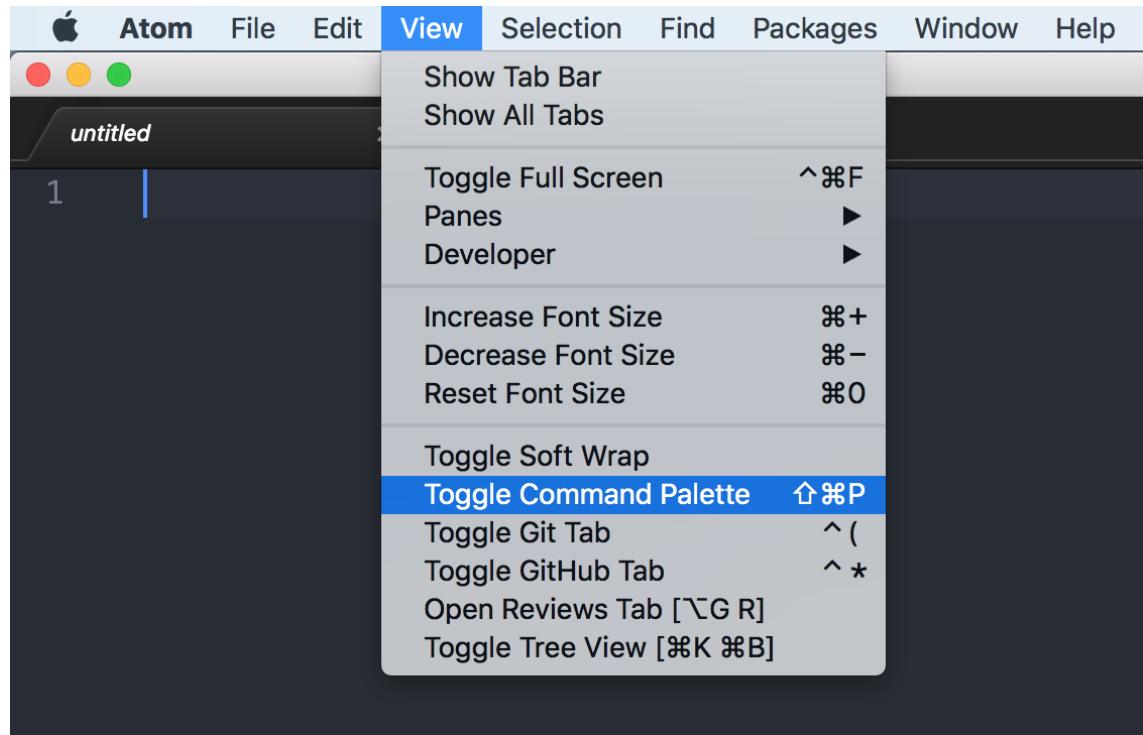

Finally, click the lock on the bottom left to lock the settings

You should now be able to run the Atom application

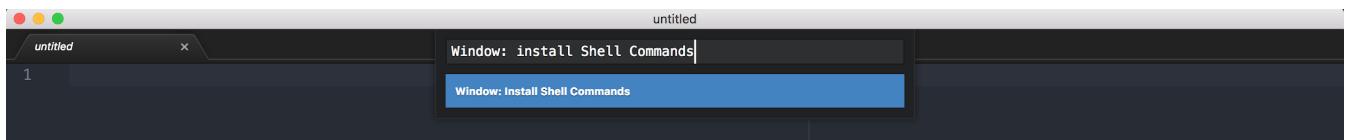

Opening files in Atom is very similar to opening files in VS Code.

- Open Atom first, then go to [File > Open](#), and choose the file you wish to edit.
- To run it from [Terminal](#), it is slightly more complicated (you need to do one step first to make it always work. Note that this step only needs to be performed the first time you open Atom).
  - First, open up the command palette within Atom (type  $\text{Shift} + \text{Command} + \text{P}$ ) or click view on the top bar followed by the command palette option. Below is a screenshot of this

- and run the command called *Install Shell Commands* into the command palette and hit enter. Below is a screenshot of this process

- Now you can run the `Terminal` command. Open `Terminal`, and navigate to the folder where your file is located and type `atom` followed by your file's name:

```
$ atom fileName.java
```

For example, if I have a file called `helloWorld.java`, then I would type the following to open it in Atom:

```
$ atom helloWorld.java
```

## Running Java Code

The last step to getting Java to work is making sure you know how to run Java files. This will be covered in class, but will be here as a reminder.

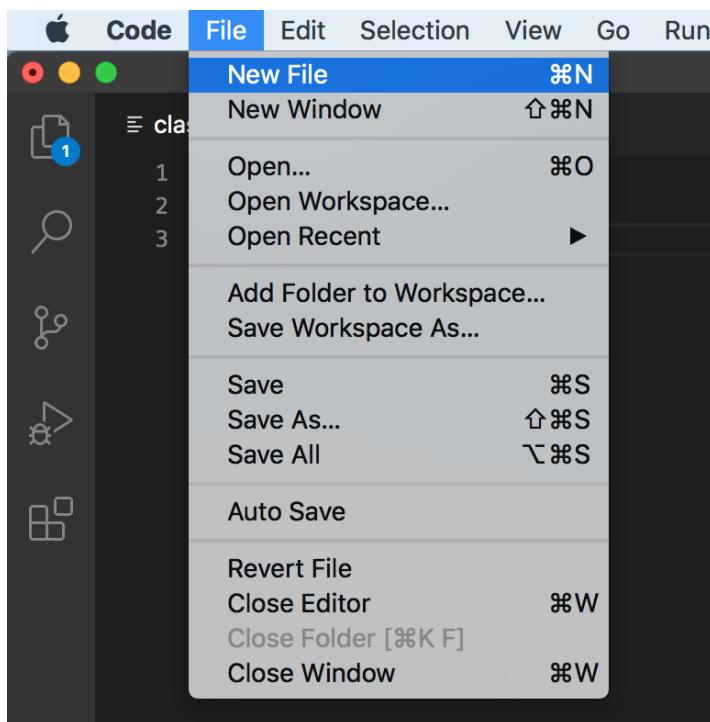

First open your preferred text editor by clicking the application icon or typing the following in terminal to open either VS Code or Atom:

```
$ code
```

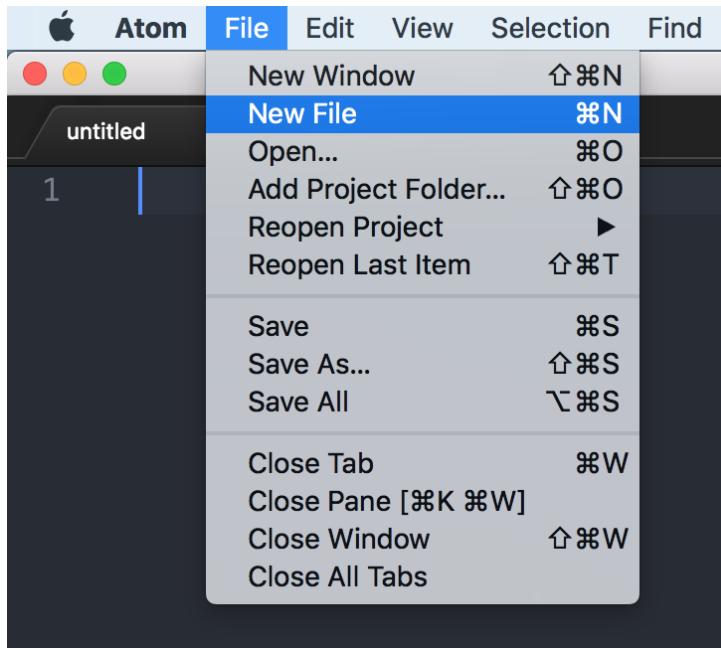

```
$ atom
```

Once the text editor is open, we will begin by making a java file. Below are screenshots of how to do this in either VS Code or Atom

In VS Code click on File followed by New File:

In Atom click on File followed by New File:

Once you have a new file open, type the following code into the file. Do note that it is case sensitive so make sure there are no typos before moving onto the next step:

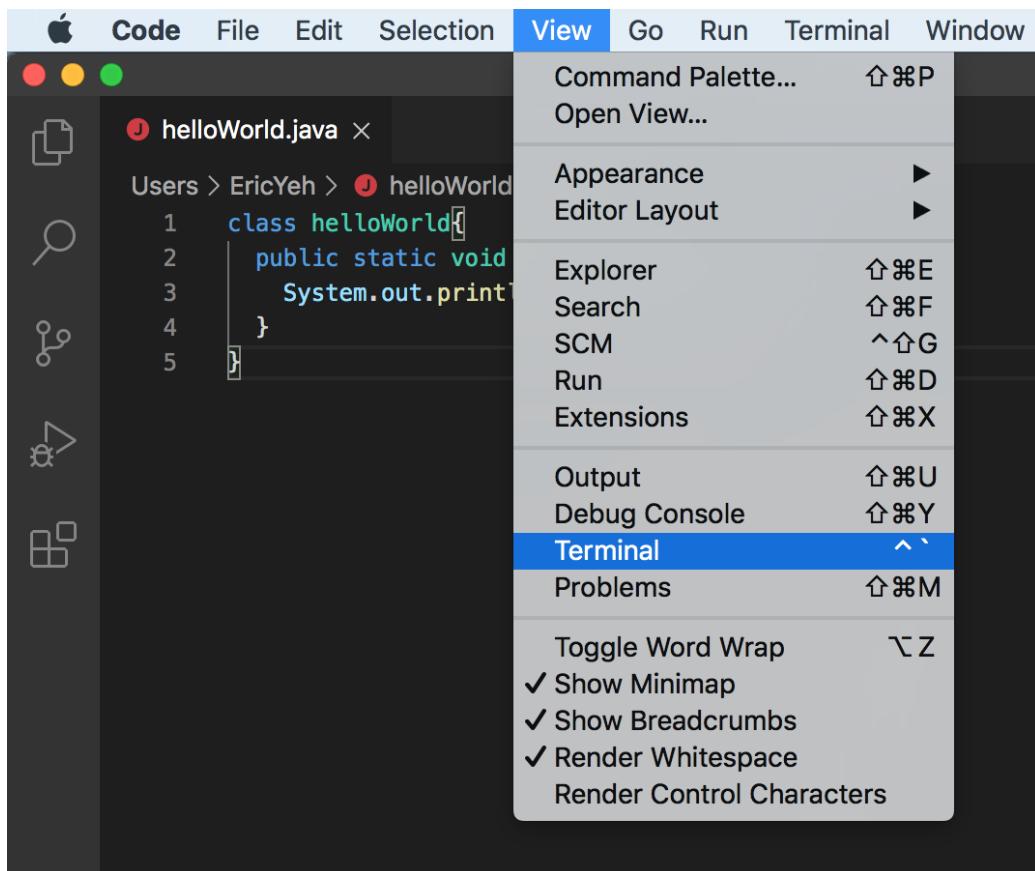

A screenshot of the Atom text editor showing a Java file named 'helloWorld.java'. The code in the file is:

```
1 class helloWorld{
2     public static void main(String[] args){
3         System.out.println("Hello World!");
4     }
5 }
```

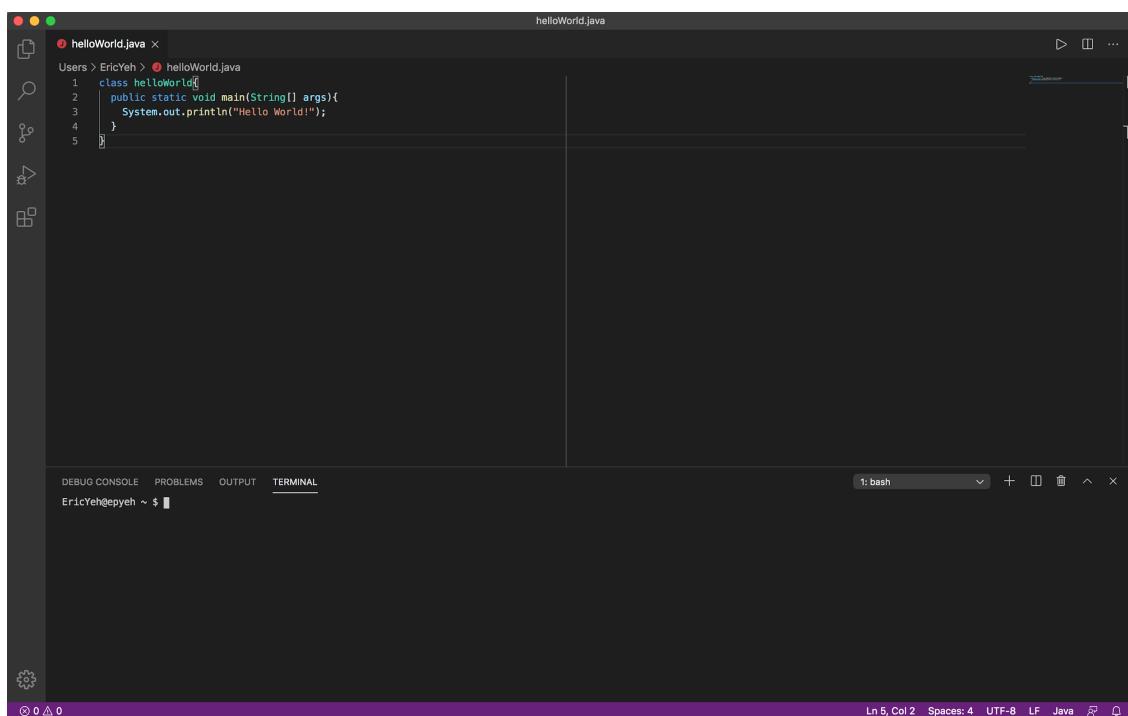

Make sure to save your file by clicking on File followed by save!

Next we will open the in-built terminal.

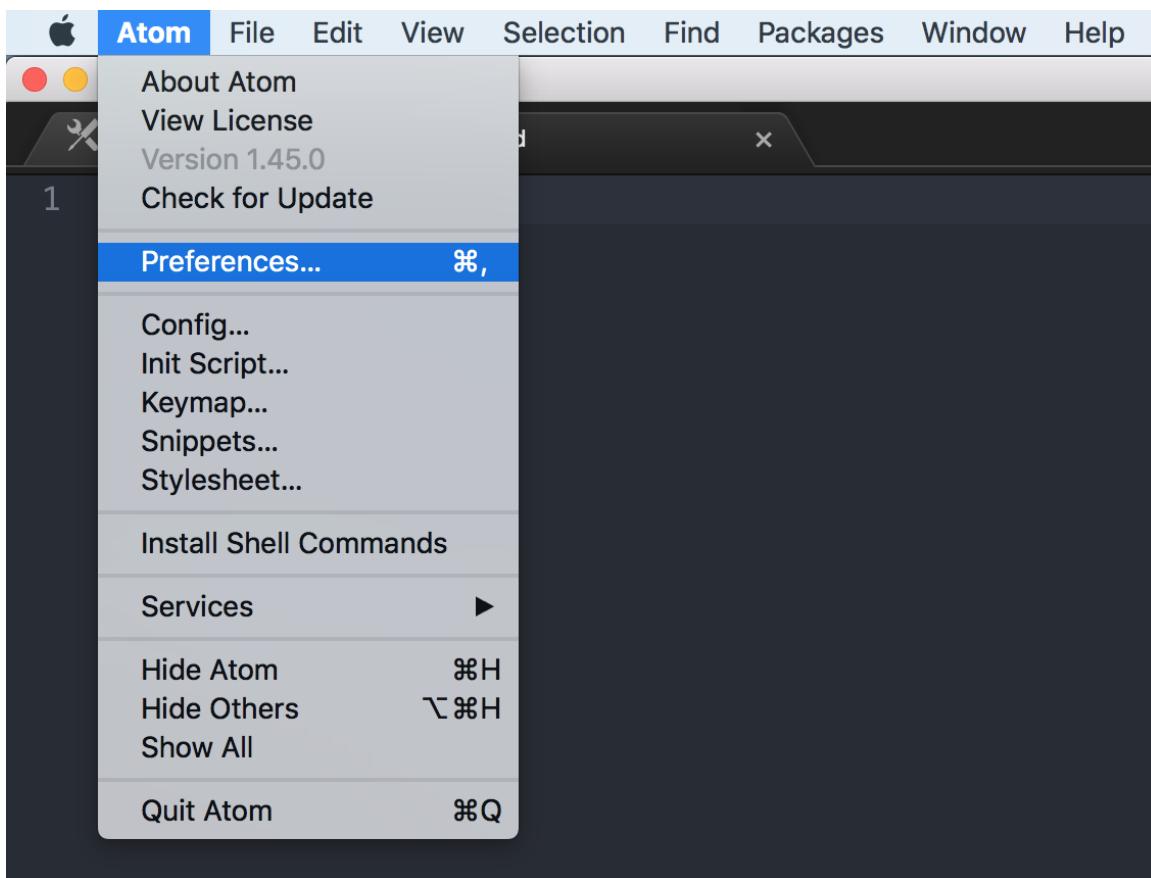

In VS Code it is opened by clicking View followed by Terminal. Below is a screenshot illustrating this.

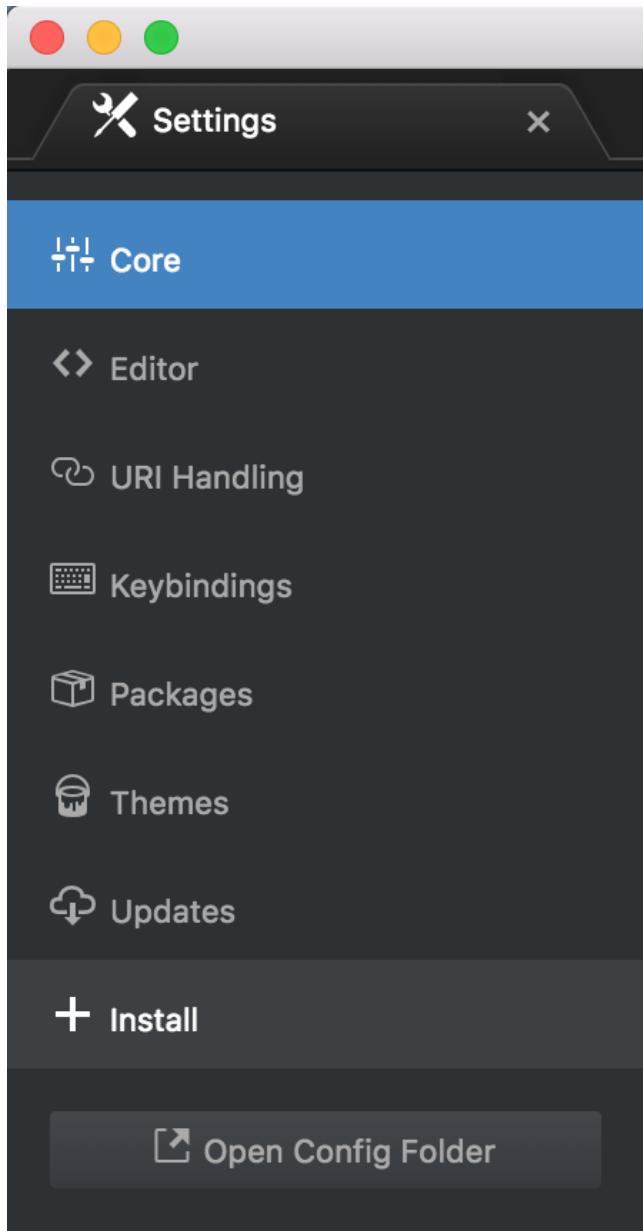

After clicking this your VS Code should now look like the following with a terminal tab:

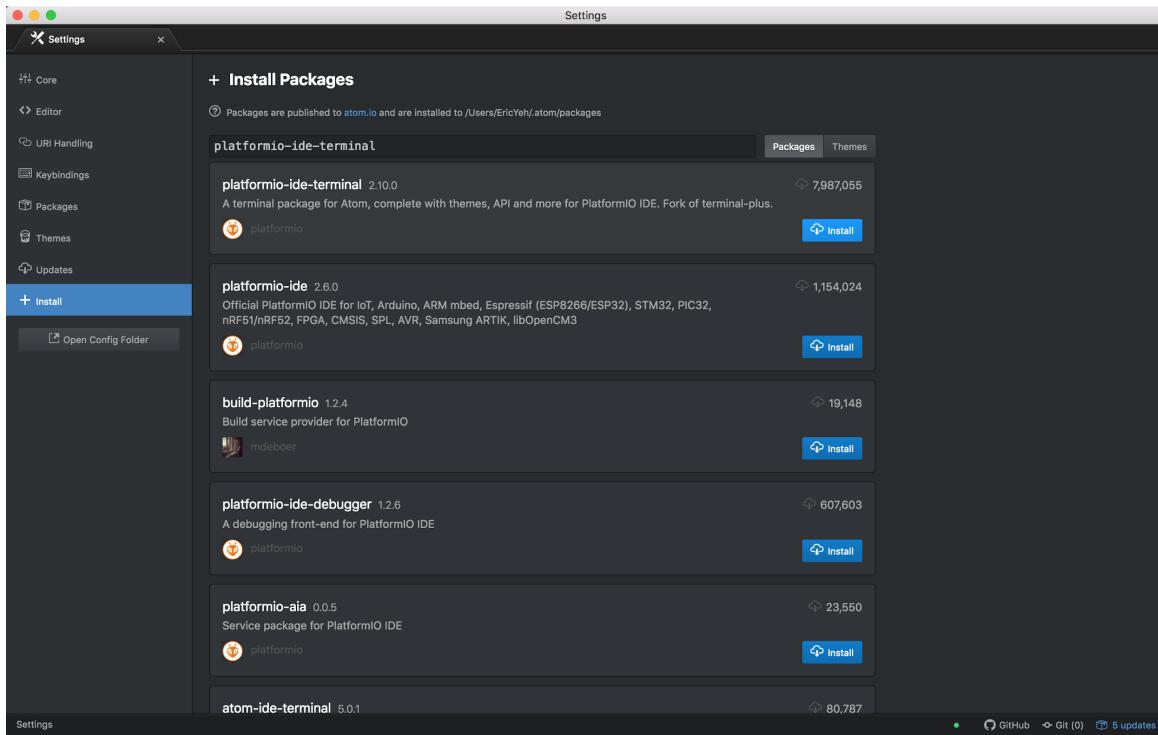

In Atom it is slightly more complicated as it requires installing additional packages. First click on Atom in the toolbar followed by clicking on preferences. Below is a screenshot for this process

Once the window pops up, click on the install tab. In the screenshot below it is lightly highlighted in grey (not the one in blue)

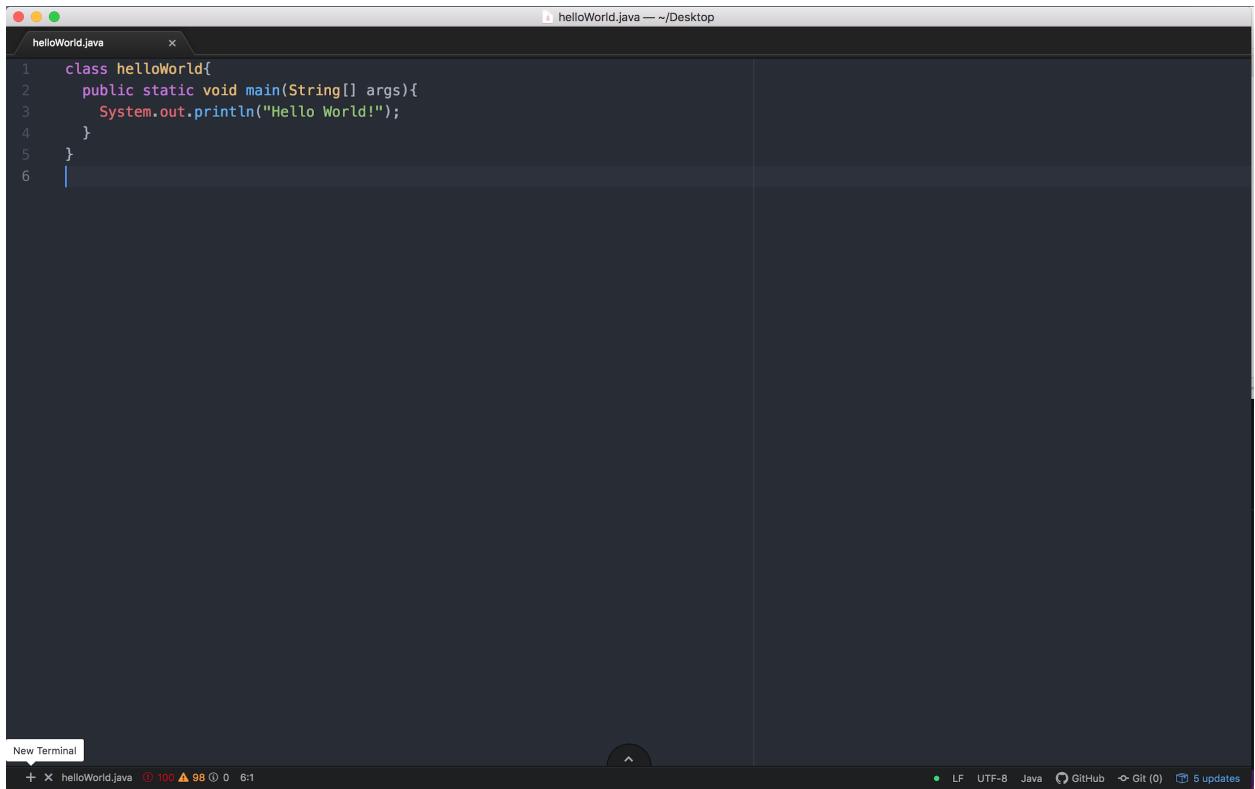

After clicking on install, type “platformio-ide-terminal” in the search bar. You should see the following pop up

Click install on the first one

After successfully installing it, return back to the helloWorld file. Then click the new terminal button in the bottom left. Below is a screenshot illustrating this.

helloWorld.java

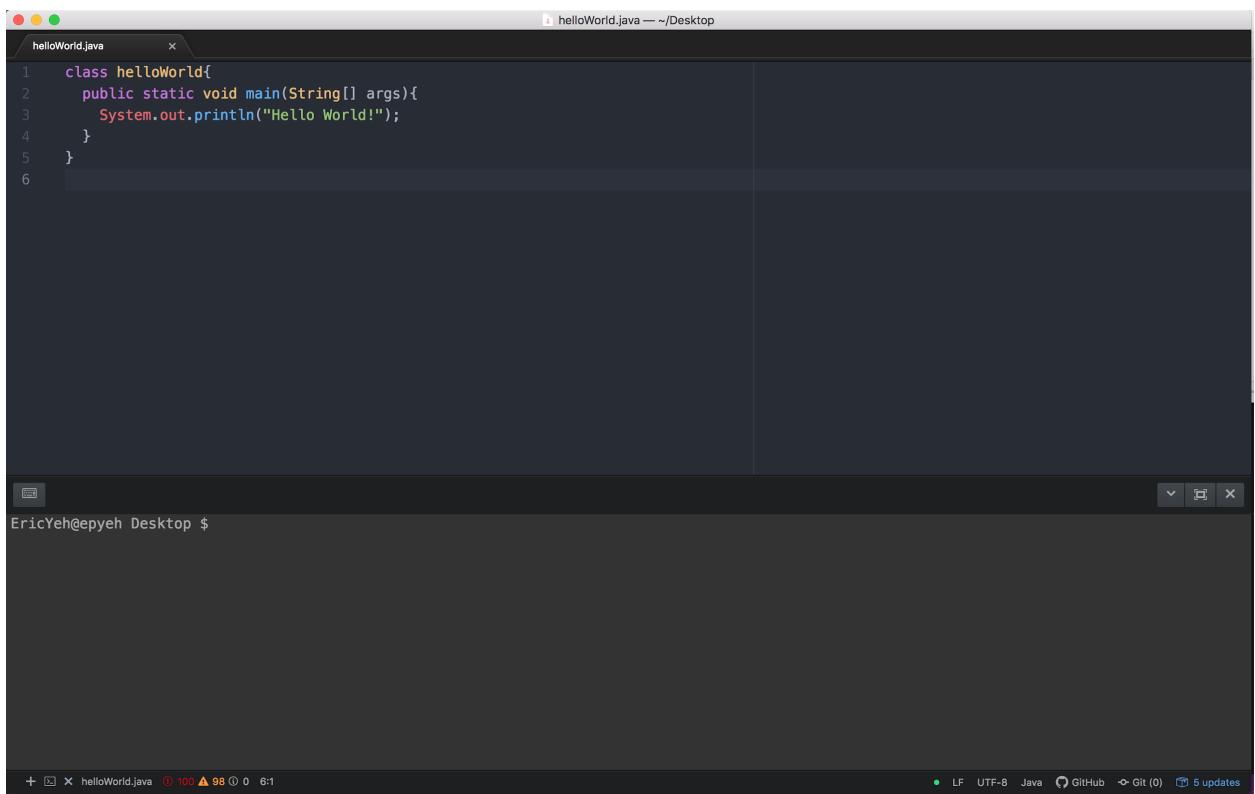

```
1 class helloWorld{
2     public static void main(String[] args){
3         System.out.println("Hello World!");
4     }
5 }
```

New Terminal

+ x helloWorld.java ① 100 ▲ 98 ① 0 6:1

LF UTF-8 Java GitHub Git (0) 5 updates

After clicking on the open terminal button atom should now look like:

helloWorld.java

```
1 class helloWorld{
2     public static void main(String[] args){
3         System.out.println("Hello World!");
4     }
5 }
```

EricYeh@epyeh Desktop \$

+ x helloWorld.java ① 100 ▲ 98 ① 0 6:1

LF UTF-8 Java GitHub Git (0) 5 updates

After you have successfully opened the terminal in either VS Code or Atom, we will now *compile* our java code by typing the following into the in-built terminal

```
$ javac helloworld.java
```

This will produce a file named `helloworld.class`, which will store information about the file you just compiled.

Finally, to run the file, type the following (make sure you do *not* add the “.java” part at the end of the file name):

```
$ java helloworld
```

If everything is working correctly, you should see Hello World be printed to the console!

And you’re done! Congratulations on writing your first Hello World program in Java!

# Windows Instructions

These instructions will have you run commands in the [Command Prompt](#), which comes with Windows and can be found by searching for it in the Search Bar.

**NOTE:** One thing to note throughout these instructions is that whenever a [Command Prompt](#) command is offered, don't include the "\$" in the command - that is there to signal to you that it is a command.

## Java

You will be editing your code and running it in 2 separate applications.

### Getting Java on Your Machine

To check if you have Java, type the following command in your [Command Prompt](#):

```
$ java --version
```

It should give you a version number that is 11 or higher.

If it doesn't list a number 11 or above, or if an error gets produced saying there is "No Java runtime present", then you need to get the updated version.

To do that, go to [this link](#). Click the button that says "jdk-11.0.4\_windows-x64\_bin.exe" (accept the License Agreement first).

The screenshot shows the Oracle Java SE Development Kit 11.0.4 download page. At the top, a message states: "You must accept the [Oracle Technology Network License Agreement for Oracle Java SE](#) to download this software." Below this are two radio buttons: "Accept License Agreement" (selected) and "Decline License Agreement". A table below lists download links for different platforms:

Product / File Description	File Size	Download
Linux	147.85 MB	<a href="#">jdk-11.0.4_linux-x64_bin.deb</a>
Linux	154.6 MB	<a href="#">jdk-11.0.4_linux-x64_bin.rpm</a>
Linux	172.01 MB	<a href="#">jdk-11.0.4_linux-x64_bin.tar.gz</a>
macOS	166.58 MB	<a href="#">jdk-11.0.4_osx-x64_bin.dmg</a>
macOS	166.95 MB	<a href="#">jdk-11.0.4_osx-x64_bin.tar.gz</a>
Solaris SPARC	188.21 MB	<a href="#">jdk-11.0.4_solaris-sparcv9_bin.tar.gz</a>
Windows	151.22 MB	<a href="#">jdk-11.0.4_windows-x64_bin.exe</a>
Windows	171.25 MB	<a href="#">jdk-11.0.4_windows-x64_bin.zip</a>

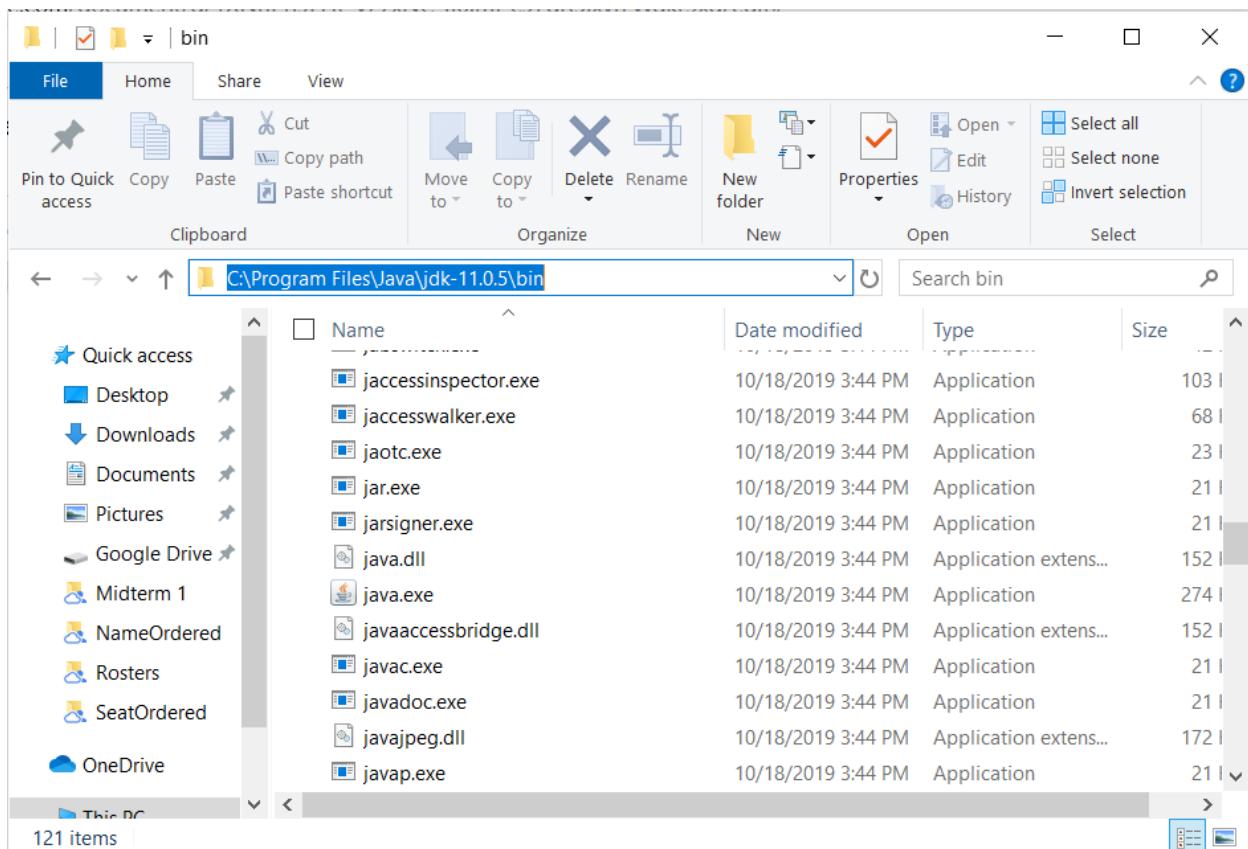

It will ask you to Login to Oracle, or create an account. Login, or create an account if you don't have one. Re-login if you created an account, and the download should start.

When you've finished the download, click it and follow the installer.

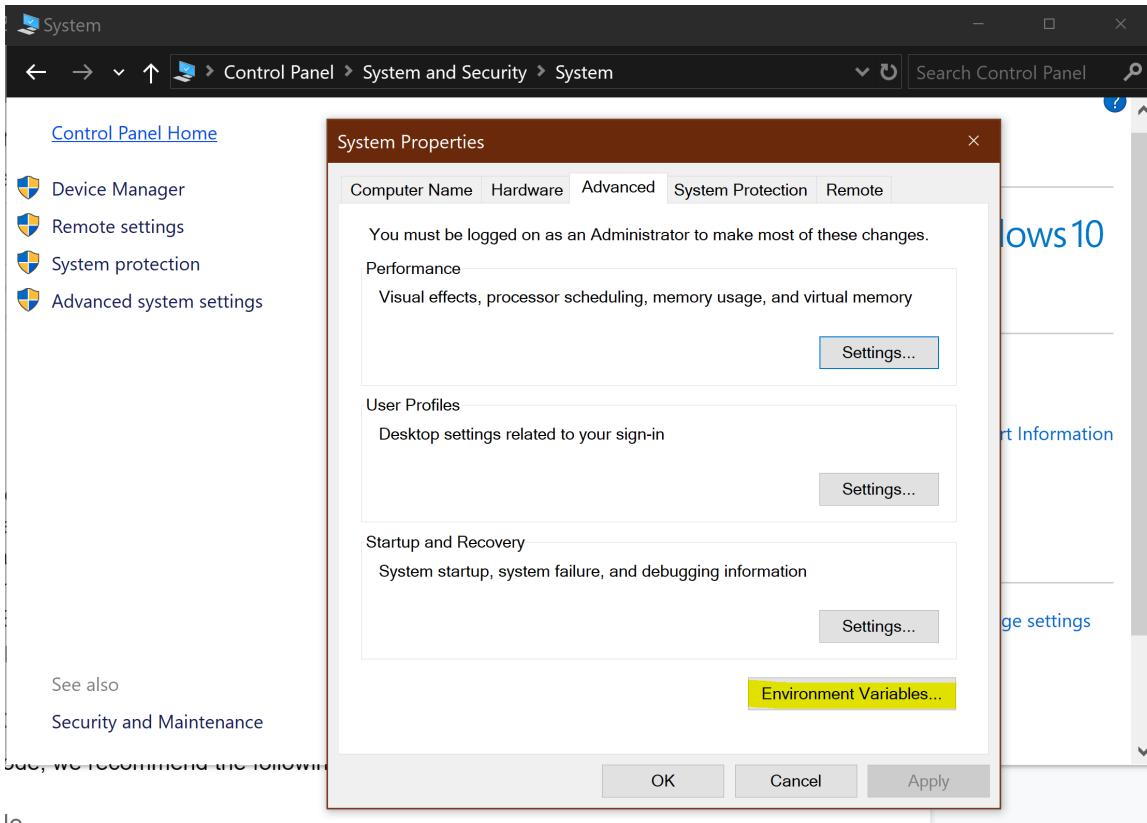

Re-run the "java" command from above to make sure you have the correct version.

Type `javac` in the command prompt and see the output, if you get javac is not recognized as an internal or external command, this means the JDK Path is not set. To do this do the following:

1. Find the location of your Java folder. Go into the folder of the java version you just installed, and then go into the bin folder, which is inside that folder. In the bin folder you should see the files javac.exe and java.exe. Highlight the path and copy it

2. Open Control Panel and Select System and Security
3. Select System
4. Select Advanced System Settings
5. Select Environment Variables

## 6. Select and Edit Path Environment variable

The screenshot shows the "Environment Variables" dialog box. It has two tabs: "User variables for Erikka Linn" and "System variables". The "User variables" tab is active, showing a table of environment variables:

Variable	Value
OneDrive	C:\Users\Erikka Linn\OneDrive
OneDriveConsumer	C:\Users\Erikka Linn\OneDrive
Path	C:\Users\Erikka Linn\AppData\Local\Programs\Python\Python37\... (highlighted)
TEMP	C:\Users\Erikka Linn\AppData\Local\Temp
TMP	C:\Users\Erikka Linn\AppData\Local\Temp

At the bottom of this tab are "New...", "Edit...", and "Delete" buttons, with "Edit..." highlighted by a yellow box. The "System variables" tab is shown below, containing a similar table with entries like ComSpec, DriverData, and NUMBER\_OF\_PROCESSORS.

7. Click new and paste the path to your Java folder. Click ok.
8. Finally, open a *new* command prompt window again type `javac`

## Editing Java Code

To edit your Java code, we recommend the following 2 text editors.

### Visual Studio Code

Follow [this](#) link, and click the Windows Download button:

Open the downloaded file once it's done, and follow the instructions there on how to finish the download.

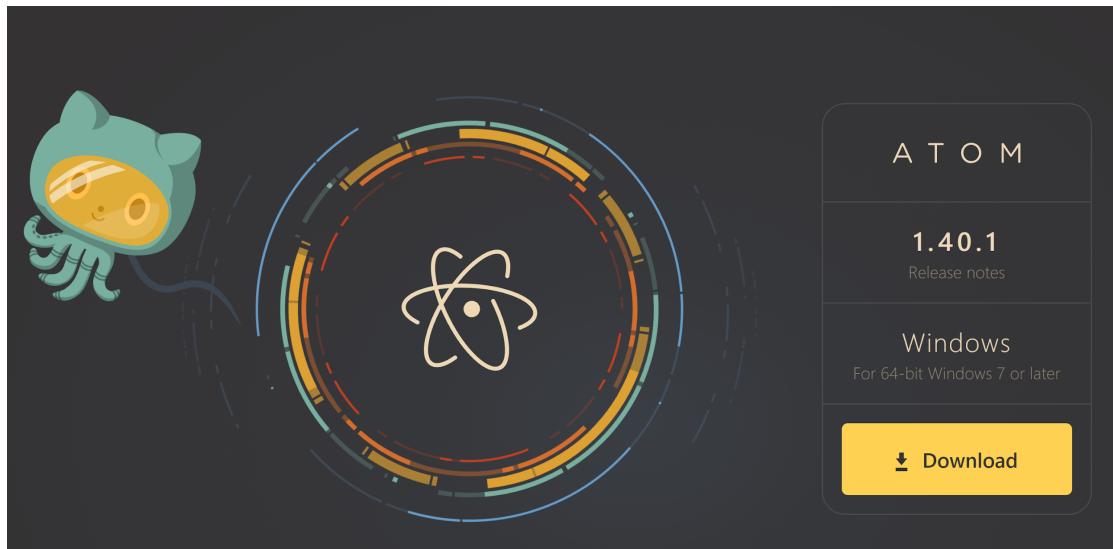

To open files in VS Code, there are two ways to do this.

- One way is to open VS Code itself first. From there, go to [File > Open](#), and choose the file you wish to edit.
- The other way is to open your [Command Prompt](#), and navigate to the folder where your file is located. Then type `code` followed by your file's name:

```
$ code fileName.java
```

## Atom

Follow [this](#) link, and click the Download button:

Opening files in Atom is very similar to opening files in VS Code. Open Atom first, then go to [File > Open](#), and choose the file you wish to edit.

## Running Java Code

The last step to getting Java to work is making sure you know how to run Java files. This will be covered in class, but will be here as a reminder.

Firstly, navigate to your file in the [Command Prompt](#). Then, type the following to *compile* your code:

```
$ javac fileName.java
```

This will produce a file named [fileName.class](#), which will store information about the file you just compiled.

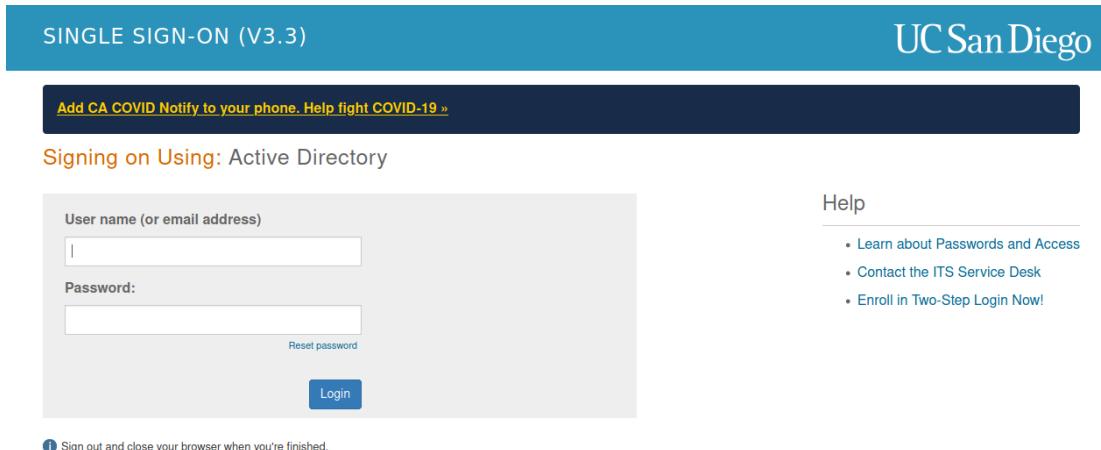

Finally, to run the file, type the following (make sure you do *not* add the ".java" part at the end of the file name):

```
$ java fileName
```

# CloudLabs Instructions

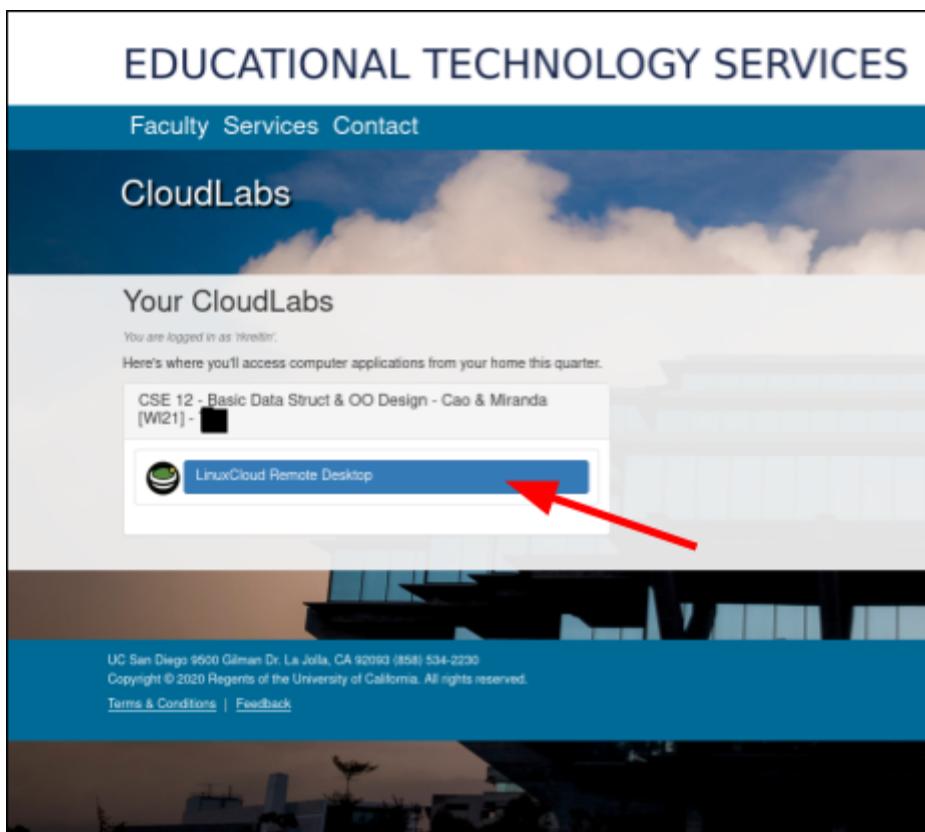

Click on the link to head to UCSD CloudLabs: <https://cloudlabs.ucsd.edu/>

Sign into the Active Directory:

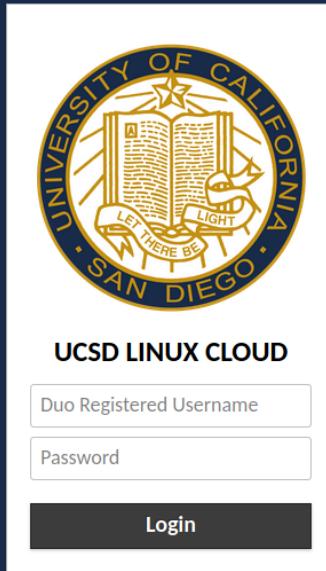

The screenshot shows the UC San Diego Single Sign-On (V3.3) login interface. At the top, it says "SINGLE SIGN-ON (V3.3)" and "UC San Diego". Below that is a dark banner with the text "Add CA COVID Notify to your phone. Help fight COVID-19 »". The main form area has fields for "User name (or email address)" and "Password", both with placeholder text. There is a "Reset password" link and a "Login" button. To the right, a "Help" section lists links to "Learn about Passwords and Access", "Contact the ITS Service Desk", and "Enroll in Two-Step Login Now!". At the bottom left, there is a note: "Sign out and close your browser when you're finished.".

You will then be directed to “Your CloudLabs” where you should see “CSE 12 - Basic Data Struct & OO Design”. Click on “LinuxCloud Remove Desktop”:

You will then be redirected to another sign-in page. Use your USCD sign-in (this is the same as the one you used before) and complete the Duo Two Factor authentication:

The image shows a screenshot of a web-based login interface for the UCSD Linux Cloud. At the top center is the official seal of the University of California, San Diego, featuring an open book, a quill pen, and the motto "LET THERE BE LIGHT". Below the seal, the text "UCSD LINUX CLOUD" is displayed in a bold, sans-serif font. Underneath this, there are two input fields: "Duo Registered Username" and "Password", both with placeholder text. A large, dark grey "Login" button is positioned below the password field. The entire form is set against a white background, which is itself centered on a dark blue rectangular background.

**Welcome to UCSD Linux Cloud**

Please login with the account you intend to use on the ETS Linux systems. Accounts without access will be denied.  
You may need to use a course specific account instead of your personal account.  
Unsure of which account to use? Please use the [Account Lookup Tool](#).  
All accounts must be registered in Duo. If you receive a "This account is not enrolled" error after login, please [enroll your account in Duo here](#).  
This service is based off Apache Guacamole. You can find a [basic user guide here](#).

Once you finish signing in, you will be directed to a page that says “Recent Connections” and “All Connections”. Under “All Connections” you have the following options:

## ALL CONNECTIONS

- + ieng6 Server Remote Desktops
- + Linux SSH terminals
- > Server Information and Account Troubleshooting

### ieng6 Server Remote Desktops:

Allows you to run a simulated desktop version of the Linux server through your browser. You can think of this as running one of the lab computers in the CSE basement through your own computer. This is more user friendly as it includes a graphical user interface.

### Linux SSH terminals:

Allows you to run only the Linux server terminal through your browser. There is no interface so everything must be done with command lines. If you want extra practice with navigating and coding with the terminal this is a great way to challenge yourself! Note, we will not be covering command lines for the

```
Hello rkreitin, you are currently logged into ieng6-243.ucsd.edu
You are using 0% CPU on this system

To see all available software packages, type "prep -l" at the command prompt,
or "prep -h" for more options.
[rkreitin@ieng6-243]:~:4$
```

terminal aside from compiling and running java files. However, CSE 15L should cover some basics.

When you expand the list (click on the + sign), you will see different machines you can connect to. You may click on any of the options and it will launch either the remote desktop or the terminal (depending on what you chose to use above). Note, try to choose a machine that is not as busy.

All of your work will be saved to your account so you may use any of the machines and still have access to your work. For example, if you save a file to the “Documents” folder in ieng6-240.ucsd.edu, you can access it from ieng6-241.ucsd.edu, ieng6-242.ucsd.edu, and so on.

**ALL CONNECTIONS**

- ⊖ ieng6 Server Remote Desktops
  - ieng6-240.ucsd.edu
  - ieng6-241.ucsd.edu
  - ieng6-242.ucsd.edu
  - ieng6-243.ucsd.edu
